

# introducing the first eco-friendly asphalt sealant.

BioSeal is now applying *Biorestor*<sup>®</sup>- a patented, 100% Eco-Friendly agricultural & polymer-based product that has been laboratory-tested and designed to protect asphalt surfaces from the effects of oxidizing and aging which result in raveling and cracking. Rather than sitting on top of the asphalt, BioSeal's product penetrates the asphalt effectively preserving the binder in a manner that will not wear off. This will help prevent raveling and rutting as well as impede the oxidation process caused by water air and UV. While BioSeal is especially effective on new asphalt, it is equally effective in protecting older asphalt pavements to protect against further deterioration & structural decay.

- **environmentally-friendly**  
The industry's only earth-friendly pavement preserver. Dye & petroleum free.
- **rapid dry time**  
Dries completely within 30 minutes. As the BioSeal product is clear, no stripping is required following application.
- **pavement flexibility**  
Penetrates up to 1/2 " and seals pavement oils; reducing the effects of aging & impeding the oxidation process.
- **no sand treatments**  
BioSeal's effects on friction values are non-existent and no sand treatments are required.
- **cost savings**  
Lowers application costs by quickening the pavement maintenance procedure while reducing pavement aging by 50% over a 5 year period.
